A

IBM Docket No. RSW9-2000-0008-US1

**In the United States Patent and Trademark Office  
Patent Application Transmittal**

*Transmitted herewith for filing is the Patent Application of:*

Inventors(s): Arthur R. Francis and Brad B. Topol

For: System, Apparatus and Method for Transformation of Java Server Pages into  
PVC Formats

**Enclosed are**

21 pages of specification, including 28 claims, plus 7 sheets of *formal* drawings.

X An assignment of the invention to International Business Machines Corporation, Armonk, New York 10504.

A certified copy of a/an application.

X Declaration and Power of Attorney.

PTO-1449 & references

X A return post card

Other:

**Filing Fee Calculation (For Other Than Small Entity)**

Basic Fee:						\$690.00
Claims Fees:	Filed	Limit	Extra		Rate per Extra	
Total claims:	28	20	8		\$18.00	\$144.00
Independent claims:	4	3	1		\$78.00	\$78.00
Multiple Dependent Claim Presented					\$260.00	\$0.00
<b>Total</b>						<b>\$912.00</b>

Please charge Deposit Account 09-0461 for the Total set forth above. The Commissioner is authorized to charge payment of any additional filing fees required under 37 CFR §1.16 and any patent application processing fees under 37 CFR §1.17 or to credit any overpayment to the identified account. A duplicate copy of this sheet is enclosed.

**Express Mail Certificate**

Express Mail Label No: EJ922406444US

Date: April 6, 2000

I hereby certify that I am depositing the papers identified above with the U.S. Postal Service "Express Mail Post Office to Address" service on the above date, addressed to the Commissioner of Patents and Trademarks, Washington, DC 20231.

## SYSTEM, APPARATUS AND METHOD FOR TRANSFORMATION OF JAVA SERVER PAGES INTO PVC FORMATS

### BACKGROUND OF THE INVENTION

#### 1. Technical Field:

The present invention is directed to a system, apparatus and method for the transformation of Java server pages into formats for various pervasive computing (PvC) devices.

#### 2. Description of Related Art:

The use of Java Server Pages (JSPs) for the generation of dynamic HyperText Mark-up Language (HTML) content is becoming more popular. JSP provides a methodology by which information related to the content

and information related to the presentation of the content may be separated. For example, JSP provides a <bean> tag which is utilized to obtain content, such as Java applets, while HTML tags are used to specify presentation of the content.

A problem arises in these prior JSPs in that they are designed with the assumption that the presentation of the content will be rendered in a browser that executes on a desktop workstation with a full-sized, high resolution, full-color monitor. As the use of mobile handheld pervasive computing (PvC) devices becomes more prevalent, the assumption used in the design of JSPs becomes a stumbling block since there is a need to deliver the JSP to a variety of PvC devices whose browsing screen size capabilities are drastically different from that of a desktop workstation.

One way to address this problem is to have a transcoding proxy server, or servlet, intercept the JSP and transcode it dynamically, i.e., on the fly, as the JSP is being sent to the PvC device. This option results in extra overhead costs incurred each and every time the JSP is invoked.

A second approach to solving this problem is to have a human JSP developer design and create separate JSPs for each and every PvC device one might want to support. This approach has the disadvantage of extra cost required to have the additional JSPs authored by a human developer who needs to be cognizant of the capabilities of the PvC devices he or she intends to support.

[illegible]

## BRIEF DESCRIPTION OF THE DRAWINGS

The novel features believed characteristic of the invention are set forth in the appended claims. The invention itself, however, as well as a preferred mode of use, further objectives and advantages thereof, will best be understood by reference to the following detailed description of an illustrative embodiment when read in conjunction with the accompanying drawings, wherein:

**Figure 1** is an exemplary block diagram of a distributed data processing system according to the present invention;

**Figure 2** is an exemplary block diagram of a server according to the present invention;

**Figure 3** is an exemplary diagram illustrating the use of HTML tags to create an HTML document;

**Figure 4** is an exemplary diagram of the use of JSP tags along with HTML tags in a JSP;

**Figure 5** is an exemplary diagram illustrating the phases of operation of the present invention;

**Figure 6** is a flowchart outlining an exemplary operation of the present invention; and

**Figure 7** is a flowchart outlining an exemplary operation of the present invention for converting a JSP file to a PvC specific JSP file.

## DETAILED DESCRIPTION OF THE PREFERRED EMBODIMENT

With reference now to the figures, and in particular with reference to **Figure 1**, a pictorial representation of a distributed data processing system is depicted in which the present invention may be implemented. Distributed data processing system **100** is a network of computers in which the present invention may be implemented. Distributed data processing system **100** contains network **102**, which is the medium used to provide communications links between various devices and computers connected within distributed data processing system **100**. Network **102** may include permanent connections, such as wire or fiber optic cables, or temporary connections made through telephone connections. Network **102** may further include wireless communication connections through, for example, base stations, satellites, and the like, for communicating with wireless communication devices.

In the depicted example, server **104** is connected to network **102**, along with storage unit **106**. In addition, clients **108**, **110**, **112** and **118** are also connected to network **102**. These clients, **108**, **110**, **112** and **118**, may be, for example, personal computers, network computers, personal digital assistants (PDAs), alphanumeric pagers, cellular telephones, and the like. Any communication device, either wired or wireless, that is capable of receiving and displaying a Java Server Page (JSP) is intended to be within the scope of the term "client" as used in this disclosure.

In the depicted example, server **104** provides data, such as boot files, operating system images and applications, and in particular JSPs, to clients **108-118**. Clients **108-118** are clients to server **104**. Distributed data processing system **100** may include additional servers, clients, and other devices not shown.

In the depicted example, distributed data processing system **100** is the Internet, with network **102** representing a worldwide collection of networks and gateways that use the TCP/IP suite of protocols to communicate with one another. At the heart of the Internet is a backbone of high-speed data communication lines

between major nodes or host computers consisting of thousands of commercial, government, education, and other computer systems that route data and messages. Of course, distributed data processing system 100 also may be implemented as a number of different types of networks such as, for example, an intranet or a local area network. **Figure 1** is intended as an example and not as an architectural limitation for the processes of the present invention.

Referring to **Figure 2**, a block diagram of a data processing system which may be implemented as a server, such as server 104 in **Figure 1**, is depicted in accordance with the present invention. Data processing system 200 may be a symmetric multiprocessor (SMP) system including a plurality of processors 202 and 204 connected to system bus 206. Alternatively, a single processor system may be employed. Also connected to system bus 206 is memory controller/cache 208, which provides an interface to local memory 209. I/O bus bridge 210 is connected to system bus 206 and provides an interface to I/O bus 212. Memory controller/cache 208 and I/O bus bridge 210 may be integrated as depicted. Peripheral component interconnect (PCI) bus bridge 214 connected to I/O bus 212 provides an interface to PCI local bus 216. A number of modems 218-220 may be connected to PCI bus 216. Typical PCI bus implementations will support four PCI expansion slots or add-in connectors.

Communications links to network computers 108-112 in **Figure 1** may be provided through modem 218 and network adapter 220 connected to PCI local bus 216 through add-in boards. Additional PCI bus bridges 222 and 224 provide interfaces for additional PCI buses 226 and 228, from which additional modems or network adapters may be supported. In this manner, server 200 allows connections to multiple network computers. A memory mapped graphics adapter 230 and hard disk 232 may also be connected to I/O bus 212 as depicted, either directly or indirectly.

Those of ordinary skill in the art will appreciate that the hardware depicted in **Figure 2** may vary. For example, other peripheral devices, such as optical disk drives and the like, also may be used in addition to or in place of the hardware depicted. The depicted example is not meant to imply architectural limitations with respect to the

present invention. The data processing system depicted in **Figure 2** may be, for example, an IBM RISC/System 6000, a product of International Business Machines Corporation in Armonk, New York, running the Advanced Interactive Executive (AIX) operating system.

5           The server **200** stores a Java Server Page (JSP) that is designed for presentation on a typical desktop workstation, such as client device **108**. The JSP is comprised of, for example, text, images and tags that are used to generate a JSP presentation on a client device when the JSP is downloaded to the client device. For example, the JSP may comprise text, HyperText Mark-up Language (HTML) tags  
10 identifying presentation formats of the text, HTML tags identifying in-line image files to be displayed, and JSP tags. JSP tags are used to encapsulate scripting language fragments into an HTML page. JSP pages use JSP tags or scriptlets to generate the dynamic content on the page (the content that changes according to the request, such as requested account information or the price of a specific bottle of wine). The logic that generates the content is encapsulated in tags and JavaBean components, and tied  
15 together in scriptlets, all of which are executed on the server side. More information regarding JSP technology and JSP tags may be obtained from the JSP section of the Sun Corporation Web site at <http://java.sun.com/products/jsp>, which is hereby incorporated by reference.

20           While the present invention will be described with reference to HTML tags, one of ordinary skill in the art should appreciate that any mark-up language, such as XML, may be utilized without departing from the spirit and scope of the present invention.

25           **Figure 3** illustrates an example of the use of HTML tags to dictate the manner in which text information is displayed by a browser on a client device. As shown in **Figure 3**, the HTML tags may include tags identifying headers, titles, text bodies, paragraphs, underlining, bold text, and the like. The bottom portion of **Figure 3** shows how these tags are processed by the browser application to generate a formatted Web page for display to a user.

JSPs use tags in a similar manner as the HTML tags shown in **Figure 3** to designate the format of the JSP page as it will be displayed. The JSPs further include JSP tags designating JSP components, such as Java beans or applets, that are to be executed when accessing the JSP. **Figure 4** provides an example of the use of HTML tags and JSP tags for a simplified JSP. As shown in **Figure 4**, the JSP includes HTML tags **410** and **420** that designate formatting of text information **430**. The JSP further includes JSP tag **440**, which reads “<jsp:forward page=”{www.hauntedhouse.com|<%=HauntedHouse.class%>}”/>”, that forwards a client request to a JSP file “HauntedHouse.class” for processing.

The JSP tags are applicable to any client device. Thus, the JSP tags need not be modified when converting a general JSP to a PvC device specific JSP for a PvC device having different capabilities than a desktop workstation. The HTML tags, however, do require modification so that they are consistent with the capabilities of the PvC device to which the JSP is transmitted.

The present invention provides a system, apparatus and method for converting JSPs designed for desktop workstations, into JSPs that are useable by a plurality of PvC devices. The present invention parses a JSP to locate and mask the JSP tags and convert the HTML tags to PvC device specific HTML tags. The method according to the present invention may be implemented, for example, as one or more Java applications, applets, or Java beans resident on a server of a distributed data processing system, such as server **140** or server **200**.

The Java beans may be executed when, for example, a system operator designates, via an input device (not shown), that a JSP is to be converted for use by PvC devices. Alternatively, the Java beans may be executed when a request is first received from a PvC device.

For example, with reference to **Figures 1** and **2**, when a request for a JSP is received by a server **200** from a PvC device, such as PvC device **110**, the server **200** receives the request via the network adapter **220**. The server **200** then processes request by parsing header information of the request to determine the type of PvC

device from which the request was received. For example, the header of the request may include a device type identifier indicating the type of device that sent the request.

The server **200** may then search for a stored version of the requested JSP on hard disk **232** corresponding to the PvC device from which the request was received.

This search may be based on, for example, filename and filename extension. The various PvC device specific JSPs may be stored under the same filename with different extensions designating the PvC for which the JSP is formatted.

Alternatively, the filenames may be different based on the PvC for which they are formatted.

If an appropriate version is available, the JSP is sent to the PvC device. However, if an appropriate version is not available, the server **200** may invoke the Java beans to convert the JSP into a PvC specific JSP for the particular PvC device sending the request. This PvC specific JSP will then be stored on the server and utilized when later requests from similar PvC devices are received.

**Figure 5** is an illustration of the various phases implemented by the present invention. As shown in **Figure 5**, phase I of operating involves parsing the original JSP file **510** to produce a resultant file **520**. Through parsing of the original JSP file **510**, the HTML tags and JSP tags in the JSP are identified. The HTML tags and JSP tags are identified by looking for the occurrence of symbols designating the various tags. As the JSP file **510** is parsed, HTML constructs and HTML tags are written to a resultant file **520**. JSP tags are masked by writing them to the resultant file **520** as HTML comment tags. Thus, the resultant file **520** contains only valid HTML constructs, i.e., HTML tags and textual information. HTML tags are indicators in HTML documents that identify document elements, structure, formatting, and hypertext links to other documents or to included media. Enclosed within these tags is textual information that is presented to the display device.

Next, in phase II of the operation, the resultant file **520** is transcoded into one or more PvC device specific files **530**. The JSP tags that are embedded as HTML comment tags remain in the transcoded files **530** as HTML comment tags. The

transcoding of the resultant file 520 into PvC specific files 530 involves placing the identified HTML tags into a document object model and performing a transcoding node by node. As is know to those of ordinary skill in the art, a document object model provides a representation of the hierarchical arrangement of document tags in a tree-like structure. Each node of the document object model represents a document tag.

The transcoding of the present invention proceeds through the document object model node by node and converts the HTML tag associated with the node to a corresponding tag in a mark-up language useable by the particular PvC device. For example, the HTML tag may be converted to an equivalent Wireless Mark-up Language (WML) tag or a Handheld Device Markup Language (HDML) tag. Any tags that aren't supported by the mark-up language for the PvC device are removed and replaced with a closest equivalent.

As a part of this processing phase, the occurrence of in-line images will also be transcoded to the resolution of the target device. As a result of the image transcoding process, static representation of the original image will be saved with a new file extension that indicates the image conversion format. In conjunction with the image transcoding process, the links to the images in each of the generated files will be updated to reflect the transcoded file that contains the resolution requirements of the target PvC device.

In the third phase of the operation, the JSP tags are unmasked. This phase involves parsing the transcoded files, locating the hidden JSP tags and converting the file back to a valid JSP file. This may be done by parsing the transcoded files, identifying HTML comment tags, determining if the content of the HTML comment tags fit the format of a JSP tag, and removing the HTML comment tag identifiers when saving the transcoded file to thereby restore the JSP tags. In this way, a JSP file is generated that is transcoded for a specific PvC device.

**Figure 6** is a flowchart outlining an exemplary operation of the present invention. As shown in **Figure 6**, the operation starts with receiving a request for a

JSP from a PvC device (step 601). A search is then conducted for a version of the JSP that is useable by the requesting PvC device (step 602). A determination is made as to whether or not a JSP for the requesting PvC device is found (step 603). If so, the JSP is sent to the PvC device (step 604). If not, a JSP for the requesting PvC device is generated and stored (step 605). The generated JSP is then sent to the requesting PvC device (step 606). The operation then ends.

While step 605 above is described as generating only the PvC specific JSP for the requesting PvC device, the operation is not limited to such. Rather, the PvC specific JSPs for all supported PvC devices may be generated. Additionally, the PvC specific JSPs may be generated in response to a command received from a user, such as a system operator.

**Figure 7** is a flowchart outlining an exemplary operation of the present invention when generating a PvC specific JSP from an original JSP. This operation may be implemented as step 605 in **Figure 6**, described above.

As shown in **Figure 7**, the operation starts with reading a JSP file and storing the contents of the JSP file in a buffer memory (step 701). The contents of the JSP file are then parsed (step 702). A determination is made as to whether or not a tag is encountered (step 703). If not, the contents are written to a resultant file (step 704). If so, a determination is made as to whether the tag is an HTML tag (step 705). If so, the HTML tag is written to the resultant file (step 706).

If not, the tag must be a JSP tag. The JSP tag is then converted to an HTML comment tag and written to the resultant file (step 707). The process is then repeated until an end of file is encountered (step 708).

Thereafter, it is determined for which PvC devices the JSP will be converted (step 709). Then, for each PvC device, the following steps are performed. The HTML tags in the resultant file are transcoded to PvC device specific tags (step 710). A transcoded file is then stored for the PvC device containing the transcoded HTML tags and resultant file content (step 711). A determination is then made as to whether

there are more PvC devices for which the JSP should be transcoded (step 712). If so, the operation returns to step 710. If not, the operation proceeds to phase III.

In phase III, the operation performs the following steps for each of the PvC specific transcoded files that were created. The transcoded file is parsed for HTML comments tags (step 713). A determination is made as to whether a tag is encountered (step 714). If not, the operation continues to parse the transcoded file until an end of file is encountered (step 718) at which time the operation ends.

If a tag is encountered, it is determined whether or not the tag is an HTML comment tag (step 715). If not, the operation continues to parse the transcoded file until an end of file is encountered (step 718) at which time the operation ends. If so, a determination is made as to whether the HTML comment tag contains a JSP tag (step 716). If not, the operation goes to step 718. If so, the operation removes the HTML comment tag identifiers (step 717) and continues to parse the transcoded file until an end of file is encountered (step 718). The transcoded file with the restored JSP tags is then stored (step 719). After all of the transcoded files are processed, the operation ends.

Thus, the present invention provides a system, apparatus and method for automatically generating PvC specific JSP files from a general JSP file. In this way, the expense of providing JSP files for a variety of PvC devices is greatly reduced.

It is important to note that while the present invention has been described in the context of a fully functioning data processing system, those of ordinary skill in the art will appreciate that the processes of the present invention are capable of being distributed in the form of a computer readable medium of instructions and a variety of forms and that the present invention applies equally regardless of the particular type of signal bearing media actually used to carry out the distribution. Examples of computer readable media include recordable-type media such a floppy disc, a hard disk drive, a RAM, CD-ROMs, and transmission-type media such as digital and analog communications links.

## CLAIMS:

What is claimed is:

1. A method of transforming an original Java Server Page (JSP) file into a pervasive computing (PvC) device specific JSP file, comprising:
  - 5 parsing the original JSP file for JSP tags;
  - masking the JSP tags;
  - converting non-masked tags in the original JSP file into PvC device specific format tags;
  - unmasking the JSP tags; and
  - 10 storing a transformed JSP file containing the PvC device specific format tags and the JSP tags.
2. The method of claim 1, wherein masking the JSP tags includes embedding the JSP tags into HyperText Mark-up Language (HTML) comment tags.
3. The method of claim 2, wherein unmasking the JSP tags includes removing  
15 HTML comment tag identifiers from the HTML comment tags in which the JSP tags are embedded.
4. The method of claim 1, wherein storing the transformed JSP file includes storing the transformed JSP file with a filename that is unique to the particular PvC device for which the JSP file is formatted.
- 20 5. The method of claim 4, wherein the filename has a unique extension for the PvC device for which the JSP file is formatted.
6. The method of claim 1, wherein parsing the original JSP file comprises:

determining if a tag is encountered;  
if a tag is encountered, determining if the tag is an HTML tag; and  
if the tag is not an HTML tag, identifying the tag as a JSP tag.

5 7. The method of claim 6, wherein parsing the original JSP file further  
comprises:

if a tag is not encountered, writing the JSP file content to a resultant file;  
if the tag is a HTML tag, writing the HTML tag to the resultant file; and  
if the tag is a JSP tag, writing the JSP tag to the HTML file embedded in an  
HTML comment tag.

10 8. An apparatus for transforming an original Java Server Page (JSP) file into a  
pervasive computing (PvC) device specific JSP file, comprising:

a processor; and

15 a storage device, wherein the processor parses the original JSP file stored  
on the storage device for JSP tags, masks the JSP tags, converts non-masked tags in  
the original JSP file into PvC device specific format tags, unmaskes the JSP tags,  
and stores a transformed JSP file containing the PvC device specific format tags and  
the JSP tags on the storage device.

9. The apparatus of claim 8, wherein the processor masks the JSP tags by  
embedding the JSP tags into HyperText Mark-up Language (HTML) comment tags.

20 10. The apparatus of claim 9, wherein the processor unmaskes the JSP tags by  
removing HTML comment tag identifiers from the HTML comment tags in which the  
JSP tags are embedded.

11. The apparatus of claim 8, wherein the processor stores the transformed JSP file with a filename that is unique to the particular PvC device for which the JSP file is formatted.

12. The apparatus of claim 11, wherein the filename has a unique extension for the PvC device for which the JSP file is formatted.

13. The apparatus of claim 8, wherein while the processor parses the JSP file the processor:

determines if a tag is encountered;  
if a tag is encountered, determines if the tag is an HTML tag; and  
if the tag is not an HTML tag, identifies the tag as a JSP tag.

14. The apparatus of claim 8, wherein while the processor parses the JSP file, the processor further:

writes the JSP file content to a resultant file, if a tag is not encountered;  
writes the HTML tag to the resultant file, if the tag is a HTML tag; and  
writes the JSP tag to the HTML file embedded in an HTML comment tag, if the tag is a JSP tag.

15. A computer program product in a computer readable medium for transforming an original Java Server Page (JSP) file into a pervasive computing (PvC) device specific JSP file, comprising:

first instructions for parsing the original JSP file for JSP tags;  
second instructions for masking the JSP tags;  
third instructions for converting non-masked tags in the original JSP file into PvC device specific format tags;  
fourth instructions for unmasking the JSP tags; and

fifth instructions for storing a transformed JSP file containing the PvC device specific format tags and the JSP tags.

16. The computer program product of claim 15, wherein the second instructions include instructions for embedding the JSP tags into HyperText Mark-up Language (HTML) comment tags.

17. The computer program product of claim 16, wherein the fourth instructions include instructions for removing HTML comment tag identifiers from the HTML comment tags in which the JSP tags are embedded.

18. The computer program product of claim 15, wherein the fifth instructions include instructions for storing the transformed JSP file with a filename that is unique to the particular PvC device for which the JSP file is formatted.

19. The computer program product of claim 18, wherein the filename has a unique extension for the PvC device for which the JSP file is formatted.

20. The computer program product of claim 15, wherein the first instructions include instructions for:

determining if a tag is encountered;  
if a tag is encountered, determining if the tag is an HTML tag; and  
if the tag is not an HTML tag, identifying the tag as a JSP tag.

21. The computer program product of claim 20, wherein the first instructions further include instructions for:

writing the JSP file content to a resultant file, if a tag is not encountered;  
writing the HTML tag to the resultant file, if the tag is an HTML tag; and

writing the JSP tag to the HTML file embedded in an HTML comment tag, if the tag is a JSP tag.

22. A system for transforming an original Java Server Page (JSP) file into a pervasive computing (PvC) device specific JSP file, comprising:

means for parsing the original JSP file for JSP tags;

means for masking the JSP tags;

means for converting non-masked tags in the original JSP file into PvC device specific format tags;

means for unmasking the JSP tags; and

means for storing a transformed JSP file containing the PvC device specific format tags and the JSP tags.

23. The system of claim 22, wherein the means for masking embeds the JSP tags into HyperText Mark-up Language (HTML) comment tags.

24. The system of claim 23, wherein the means for unmasking removes HTML comment tag identifiers from the HTML comment tags in which the JSP tags are embedded.

25. The system of claim 22, wherein the means for storing stores the transformed JSP file with a filename that is unique to the particular PvC device for which the JSP file is formatted.

26. The system of claim 25, wherein the filename has a unique extension for the PvC device for which the JSP file is formatted.

## ABSTRACT OF THE DISCLOSURE

### SYSTEMS, APPARATUS AND METHOD FOR TRANSFORMATION OF JAVA SERVER PAGES TO PVC FORMATS

5 A system, apparatus and method for transforming Java Server Pages (JSPs) into  
pervasive computing (PvC) device specific JSPs. An original JSP is parsed for JSP  
tags. The JSP tags are converted to HyperText Mark-up Language (HTML) comment  
tags. The JSP is then transformed into a PvC device specific JSP by converting the  
10 HTML tags in the JSP to HTML tags for a specific PvC device. The HTML  
comment tags are then parsed for the comment tags having embedded JSP tags. The  
JSP tags are then restored by removing the HTML comment tag identifiers. A PvC  
device specific JSP is thus created.

**DECLARATION AND POWER OF ATTORNEY  
FOR PATENT APPLICATION**

As a below named inventor, I hereby declare that:

My residence, post office address and citizenship are as stated below next to my name; I believe I am an original, first and joint inventor of the subject matter which is claimed and for which a patent is sought on the invention entitled:

**System, Apparatus and Method for Transformation of Java Server  
Pages into PVC Formats**

the specification of which is identified by the attorney (IBM) Docket Number appearing above.

I hereby state that I have reviewed and understand the contents of the above- identified specification, including the claims.

I acknowledge the duty to disclose information which is material to the patentability of this application in accordance with Title 37, Code of Federal Regulations, §1.56.

I hereby claim foreign priority benefits under Title 35, United States Code, §119 of any foreign application(s) for patent or inventor's certificate listed below and have also identified below any foreign application for patent or inventor's certificate having a filing date before that of the application on which priority is claimed:

Prior Foreign Application(s)

<u>Number</u>	<u>Country</u>	<u>Day/Month/Year</u>	<u>Priority Claimed</u>
---------------	----------------	-----------------------	-------------------------

I hereby claim the benefit (a) under Title 35, United States Code, §119(e) of any U.S. application listed below and identified as a provisional application or (b) under Title 35, United States Code, §120 of any U.S. application listed below and not identified as a provisional application, and, insofar as the subject matter of each of the claims of this application is not disclosed in the prior U.S. application in the manner provided by the first paragraph of Title 35, United States Code, §112, I acknowledge the duty to disclose information material to the patentability of this application as defined in Title 37, Code of Federal Regulations, §1.56 which occurred between the filing date of the prior application and the national or PCT international filing date of this application

Prior U.S. Applications

<u>Serial No.</u>	<u>Filing Date</u>	<u>Status</u>
-------------------	--------------------	---------------

I hereby declare that all statements made herein of my own knowledge are true and that all statements made on information and belief are believed to be true; and further that these statements were made with the knowledge that willful false statements and the like so made are punishable by fine or imprisonment, or both, under Section 1001 of Title 18 of the United States Code and that such willful false statements may jeopardize the validity of the application or any patent issued thereon.

As a named inventor, I hereby appoint the following attorneys and/or agents to prosecute this application and transact all business in the Patent and Trademark Office connected therewith:  
Bruce A. Clay, Reg. No. 32,121; Gregory M. Doudnikoff, Reg. No. 32,847; Edward H. Duffield, Reg. No. 25,970; Jerry W. Herndon, Reg. No. 27,901; Gerald R. Woods, Reg. No. 24,144; Jeanine S. Ray-Yarletts, Reg. No. 39,808; Joseph C. Redmond, Jr., Reg. No. 18,753; John E. Hoel, Reg. No. 26,279; Christopher A. Hughes, Reg. No. 26,914; and Edward A. Pennington, Reg. No. 32,588;

AND also

Send all correspondence to: Jeanine S. Ray-Yarletts, IBM Corporation T81/062; PO Box 12195; Research Triangle Park, NC 27709.
